

Internal Stain Techniques & Applications to Achieve a Natural Look

Important Principles for Anterior Applications

“Porcelain Build-up Techniques and Important Principles for Anterior Restorations: Internal Stain Techniques and Applications to Achieve Natural Look.”

All-ceramic anterior restorations are technically challenging in esthetic dentistry for both technicians and dentists due to the distinctive characteristics and appearance of a natural tooth. Among anterior restorations, the single central incisor restoration is the most difficult to match esthetically with a healthy adjacent incisor.

Utilizing proper internal stain technique prior to baking will improve the physical characteristics of the all-ceramic crown to achieve the optimal simulation of natural enamel and dentin. The lecture presents various fabrication techniques and important principles of color reproductions and the benefits of using internal stain to achieve superior esthetics in anterior fabrications.

About the Instructor:
Mr. Naoto Yuasa, RDT

Mr. Yuasa completed Post-Graduate Ceramic Program at Toho Dental Collage in 2004, and currently works as a Chief Ceramist at Otani Dental Clinic in Tokyo. He published and lectured worldwide. He is an Instructor for Kuraray Noritake Dental, Inc.

- 2002.3 - Graduated from Dental Technician course of Toho Dental College
- 2004.3 - Graduated from Advanced Dental Technician course of Toho Dental College
- 2004.4 - Entered Kondou Dental Clinic
- 2008.4 - Entered Otani Dental Clinic

Two Day Course

Course cost is \$800

October 15-16
Beverly Hills Dental Lab
Beverly Hills, CA
